

CarterPCs — fix-v16

Production-readiness pass (final)

The navigation scrolled-state scrim, the Hardware ultra-wide height governor, the placeholder-media readiness audit, and the full 54-walk cross-site QA matrix including the new 844×390 landscape viewport.

Executive summary

1 — The transparent bar let scrolling content interleave with its labels. Measured mid-scroll at 390×844 in French, SEVEN live text elements sat inside the 197px three-row bar at once — the wordmark collided with “En savoir plus”, the About pill sat on “Millions, tous réseaux”, and the bar's own Contenu/Univers labels interleaved with “En chiffres 02”. At 1440×900 body copy ran straight under the section labels in both themes. Fixed with a scrolled-state scrim: transparent at the page top (approved identity), then a 94% base-token ground + 14px backdrop blur + theme-aware hairline fading in behind the whole bar after 16px of scroll. Zero layout shift (opacity-only pseudo-element), measured AA with margin even without backdrop-filter (7.1:1 dark / 5.2:1 light against the worst passing content), instant under reduced motion, correct over both pinned sections.

2 — Hardware could not frame its object at 2560×900. The stage is width-driven (six grid columns) while the viewport height is not: it resolved 1198×856px and its lower 152px sat below the fold after an anchor jump. A vh-derived cap — the same idea as the section's own mobile 48vh rule — sizes the object to what still fits below the bar at rest: 968×691, bottom 887.9 < 900. The cap never engages at 1024–1920: those stages are pixel-identical. The FULL section (object + beats + tags) still needs ~1060px against an ~800px window — physically impossible under a fixed bar; documented, with the existing bottom-edge pin delivering the beats band on scroll.

3 — Placeholder media is production-intentional. Both dev placeholders (Hardware stage, Content Universe crops) are aria-hidden, data-dev-placeholder tagged, responsive at all nine audited viewports, and carry no contrast or clipping defects. The 1.8 MB Creator PNG is never fetched by modern browsers — the 109 KB WebP is. The exact required assets are specified for the owner.

4 — The full-site audit found no further defects. 54 walks (9 viewports × EN/FR/ES × dark/light, including the new 844×390 landscape): zero overflow, zero clipped text, zero residual animation state, zero console/page/network errors; all 12 landscape anchor landings 15.6–16.3px clear; 200% zoom, reduced motion and system theme (both OS settings) clean; skip link, focus visibility, landmarks, safe external links, image loading all verified.

Files changed

File	Change
src/components/navigation/Nav.tsx	scrolled-state detection: rAF-throttled scroll listener toggling data-scrolled at 16px; initial read on mount for mid-page reloads
src/components/navigation/Nav.module.css	the scrim: ::before overlay, 94% --color-bg-base + blur(14px) + 7% text-token hairline, opacity-only fade; header comment updated
src/sections/hardware/Hardware.module.css	ultra-wide height governor: max-inline-size (100vh – 12.75rem) × 7/5, justify-self: end, explicit inline-size: 100%
e2e/app.spec.ts	2 new tests: scrim state machine + zero layout shift (desktop & mobile), and reduced-motion instant switch — polled assertions, no fixed sleeps

D1 — navigation readability while scrolling

Reading	Before	After
live text elements inside the bar, 390×844 FR mid-scroll	7	0 visible collisions — scrim ground
body copy under section labels, 1440×900 (both themes)	yes	behind scrim
worst-case label contrast during scroll (dark / light)	ink on ink (unbounded)	7.1:1 / 5.2:1
bar height top vs scrolled (80 / 197 / 196.5px bars)	—	identical — 0.0px shift
scrim at page top / back at top	—	opacity 0 (approved identity kept)
reduced motion	—	state switches instantly (1e-05s)

The scrim only ever ADDS the base token behind the labels, so no transition frame dips below the settled contrast; mid-session theme swaps are already covered by the fix-v15 [data-theme-switching] suppression. backdrop-filter is a pure enhancement — the 94% ground alone clears AA on both themes.

D2 — Hardware object at ultra-wide, short viewports

Viewport (anchor jump)	Stage before	Stage after	Bottom vs fold
2560×900	1198×856	968×691	1052.4 → 887.9 < 900
1440×900	646×462	646×462 (unchanged)	653.5
1920×1080	870×622	870×622 (unchanged)	836.5
1024×768	455×325	455×325 (unchanged)	517.4
1280×720	573×409	573×409 (unchanged)	601.6
1536×1024	691×493	691×493 (unchanged)	685.0

Documented residual: the whole composition (object + beats + tags) is ~1062px at 2560×900 against an ~800px content window below the anchor line. Showing all of it at once under a fixed bar is physically impossible without shrinking the approved composition; the existing bottom-edge pin brings the beats band into frame as you scroll. Documented per the task instruction, not per-viewport hacked.

D3 — full-site audit matrix

Check	Result
54 full-document walks (9 viewports × 3 languages × 2 themes)	ovf 0 · clip 0 · residual 0 · bottom+footer reached · 54/54
console errors / page errors / failed requests across all walks	0 / 0 / 0
anchors at 844×390 (4 sections × 3 languages)	12/12 land 15.6–16.3px clear
200% zoom (640×360, 960×540) × 3 languages	clean
reduced motion (390×844, 844×390, 1440×900)	0 hidden reveals; 2 transforms = authored static rotations; scrim instant
system theme under OS-dark / OS-light	dark / light stamped, correct grounds
skip link, landmarks, heading order, focus visibility	verified
external links (9)	all target=_blank rel=noreferrer
images (10)	all load; correct eager/lazy split

01-before-nav-1440-dark.png

BEFORE - 1440x900 dark mid-scroll. Body copy runs straight under the bar's section labels and the About pill.

02-after-nav-1440-dark.png

AFTER - same position. The scrim grounds the bar; the hairline closes its lower edge.

03-before-nav-1440-light.png

BEFORE - 1440x900 light. Same collision on the light ground.

04-after-nav-1440-light.png

AFTER - light theme scrim (94% base token), labels at 5.2:1 worst-case.

Six territoires, un

15-after-844x390-fr-light-cu.png

NEW VIEWPORT - 844x390 FR light, #content-universe anchor: 15.7px clear.

Placeholder media — exact assets required from the owner

Slot	Required asset
Hardware stage — .mediaLayer (single drop-in target)	One approved hardware photograph or video poster of a real CarterPCs build (interior / component macro). Landscape, ≥1400×1000px (renders up to 968×691). Subject in the left/centre two-thirds — the trailing corner dissolves via mask and the top-right corner is clipped by the silhouette cut. Dark-set photography preferred.
Content Universe — data-media="hardware" → .mediaSurface	One wide landscape crop, ≥1000px wide, ≈2:1 usable area. The pin re-crops between three clip states — the subject must survive ±25% edge cropping.
Content Universe — data-media="mobile" → .mediaSurface	One vertical 9:16 frame (native Shorts still), ≥600×1067px. Slips behind the headline; edges clipped ±12% during the pin.

No other section uses placeholders — Hero, Creator and Featured already run approved or real assets. Neither placeholder claims to be final content: both are aria-hidden and tagged data-dev-placeholder.

Issues intentionally not fixed

Hardware full-section fit at 2560×900 — see D2’s residual: documented, not hacked. **No <header> landmark** — the labelled nav landmark is complete and valid; wrapping the fixed bar would change approved DOM for no assistive-tech gain. **Hero portrait alt=""** — approved art direction; the identity is carried in text. **Bar transparent at the exact page top** — approved identity; nothing can sit under the bar at rest at the top, and the scrim covers every scrolled state.

Nothing committed, pushed, reset, cleaned or reverted. Protected report folders untouched.

Verdict

Delivered. The bar keeps its approved transparent identity at the page top and is readable over any content while scrolling, at every bar height, in both themes, with zero layout shift; the Hardware object frames fully after an anchor jump at every audited viewport including 2560×900; the placeholders are intentional and specified for replacement; and the 54-walk final matrix, the landscape anchors, 200% zoom, reduced motion, system theme, structure, links and imagery all pass with zero console errors.
