

CarterPCs fix-v10 — Closing statement (06)

Summary

One new section, directly after Content Universe, built from the existing visual language and wired through the existing typed i18n system in all three languages. No footer, and nothing in the section anticipates one.

Everything above it is provably untouched: 29 of 30 before/after section captures are **0 changed pixels**, and the one exception is 14 pixels explained in full below.

One defect was found during the work — in the new section, by measurement, not by eye: **the back-to-top link rendered at opacity: 0 permanently**. It is fixed, the root cause is interesting enough to be worth reading, and it is covered by a test that would fail again if it regressed.

What was built

Element	Content
Identity	CarterPCs
Statement	Making tech / interesting.
Disclaimer	Independent creative concept. / Not affiliated with CarterPCs.
Control	Back to top ↑ → <code>#hero</code>

Files added: `src/sections/closing/Closing.tsx`, `src/sections/closing/Closing.module.css`.

Two judgement calls, stated rather than buried

Casing. The brief writes the content in capitals — `CARTERPCs`, `MAKING TECH INTERESTING`. Nothing on this site sets display type in uppercase: the Hero is "Built Different.", Creator is "Hardware knowledge, delivered without the fluff.", Hardware is "Built from the inside out." Since the brief also asks to use the existing visual language, I read the capitals as indicating the display treatment rather than literal casing, and set the statement in the site's sentence case. The identity is likewise rendered as the proper noun `CarterPCs`, exactly as the nav bar and the Hero's Featured-In strip already write it — uppercasing it would have produced `CARTERPCS`, silently restyling the identity. Both are one-line reversals if you want the literal capitals.

One element the brief did not ask for. The section carries a large "06" in its own layer behind the type. It is the same environmental-numeral device Hardware (04) and Content Universe (05) already use, it is `aria-hidden`, and it states nothing — it is visual language, not new copy. It also lands correctly: the Hero's index rail already reads "01 / 06", so Closing is the sixth section that rail has been counting all along.

What it does not contain

No social links, no handles, no contact details, no counts, no claims of any kind. Asserted, not just intended — a test walks the rendered section and fails if it finds more than one link, any `button / form / input`, any `http: / mailto: / tel: / @`, or any digit in non- `aria-hidden` text.

Translations

Added through the existing typed dictionary, so a missing key is a `npm run typecheck` failure rather than a silent English fallback.

Key	English	French	Spanish
<code>headlineLineOne</code>	Making tech	La tech rendue	Tecnología
<code>headlineLineTwo</code>	interesting.	intéressante.	que engancha.
<code>disclaimerLineOne</code>	Independent creative concept.	Concept créatif indépendant.	Concepto creativo independiente.
<code>disclaimerLineTwo</code>	Not affiliated with CarterPCs.	Sans affiliation avec CarterPCs.	Sin afiliación con CarterPCs.
<code>backToTop</code>	Back to top	Haut de page	Volver arriba

Two deliberate choices:

- **The statement is stored as two lines, not one string split in the component**, so each language breaks where it naturally breaks. French keeps its article with its noun ("La tech rendue / intéressante."); Spanish breaks after the subject ("Tecnología / que engancha.").
- **The statement reuses each language's own existing phrasing** from `hero.support` rather than inventing a second translation of the same claim. This section is the bookend to that line, so in French it is "La tech rendue intéressante" and in Spanish "Tecnología que engancha" — the wording those files already use.

`CarterPCs` is deliberately absent from the dictionary: it is a proper noun and is written as a literal, matching the policy documented at the top of `en.ts`.

The defect found during this work

The back-to-top link rendered at `opacity: 0` — permanently, not slowly. Probed at 1536×1024 after scrolling the section into view:

Element	~300 ms	~1700 ms	~3500 ms
CarterPCs	0.2287	1	1
Making tech	1	1	1
interesting.	1	1	1
Independent concept...	0	1	1
Back to top	0	0	0

Its transform finished — the element had travelled its 16px — while its opacity did not. The inline styles at rest showed why: GSAP had settled it on `opacity: 0`, meaning **0 was the tween's recorded end value**.

The only thing separating it from the two elements that worked was a CSS `transition: opacity` for its hover state. `gsap.from()` records its end value when the tween first `_renders_`; `immediateRender` had

already written `opacity: 0` at timeline-creation time, the CSS transition then carried the element to 0 for real, and when the ScrollTrigger fired later GSAP read 0 back as the "natural" value and animated 0 → 0.

Fixed on both sides:

- The entrance is now `fromTo` with both ends stated explicitly, so it never depends on reading a value back off the element. This also protects anything added to the section later.
- The link's hover transitions **colour** instead of opacity, so the CSS and the tween are no longer writing the same property. This matches the nav links' own hover treatment anyway.

Screenshots `01-before-fix-...` and `02-after-fix-...` are the same capture before and after.

The lesson generalises: any element with a CSS transition on a property GSAP also animates is exposed to this, and the site has several such elements. This one is fixed; a broader audit was out of scope for this task and is worth raising separately.

A second measurement error, corrected

The first contrast sweep reported "0 failures" — and had **silently skipped the identity line**. Its colour is a `color-mix()`, which Chromium serialises as `color(srgb 0.960784 0.960784 0.952941 / 0.62)`, and the probe's parser only matched `rgb()` / `rgba()`, so it returned null and the element was dropped instead of flagged.

Re-measured with a probe that paints each colour into a canvas and reads the pixel back — the browser's parser, not mine — and that asserts zero unparsed colours before reporting. The corrected numbers are in the table below. The identity passes, but I would not have known that from the first run.

Verification

All measured against a production build, 12 viewports × 3 languages × 2 themes = 72 combinations for the section, 576 contrast samples.

Check	Result
Page horizontal overflow	0 in all 72
Copy ink past the canvas padding box	0 in all 72
Ink past the viewport edge	never (closest: 6.4px inside at 320px)
Headline <code>clip-path</code> surviving the reveal	0 in all 72
Back-to-top target size	93.5–119.9 × 44 CSS px
Text contrast failures (dark and light)	0

Worst-case contrast per element, across all 576 samples:

Element	Dark	Light	Needs
headline lines	17.80:1	16.70:1	3
identity	7.14:1	4.93:1	4.5
disclaimer lines	7.69:1	5.76:1	4.5
back-to-top + arrow	17.80:1	16.70:1	4.5

The section numeral measures 1.17–1.18:1 and a naive sweep lists it as a failure. It is decorative, `aria-hidden`, and states nothing — and it is not a new posture: measured side by side, its colour is **byte-identical to Hardware's "04"** (`text-primary` at 0.08 alpha) and fainter than Content Universe's digits (0.1). Raising it would make the closing beat louder than the two sections above it.

Back to top works, measured rather than assumed. From the bottom of the page at 1440×900: `scrollY 9308 → 0`, `location.hash` becomes `#hero`, and the Hero's top lands at 0. It is a real anchor to an element that exists, it sits in the natural tab order, and the global `:focus-visible` ring applies (screenshot 22).

Reduced motion. The reveal is skipped entirely — the effect returns before creating any GSAP context — so nothing can be left stranded: `hidden=0`, `pinSpacers=0`, `overflow=0` at both 1440×900 and 390×844, with all copy and the control present. The arrow's hover nudge is dropped by a reduced-motion media query too, so the only motion the section can produce is disabled.

Themes. Nothing in the section is hard-coded; every colour resolves from a token, so light and the system setting that resolves to it follow the palette with no per-theme rules at all.

Nothing above it moved

Same captures, same pipeline, before and after adding the section — 30 section captures across 320×568 fr, 844×390 en, 768×1024 es, 1024×768 en, 1440×900 en light and 390×844 es light:

29 of 30 are 0 changed pixels.

The exception is **14 pixels (0.00%)** in a 12×3 box at (856, 706) of the 1024×768 Content Universe capture, shifting `rgb(16,28,29) → rgb(20,48,51)` — the teal of that section's scroll-scrubbed connecting thread. The cause is not a style change: Content Universe used to be the last section, so at 1024×768 scrolling it to the top was clamped by the end of the document and it could never actually get there. With a section below it, it now lands where it should (section top = 96px, its own `scroll-margin`), so the scrub sits at a slightly different progress at capture time. Measured after: `scrollY 8293`, `maxScroll 10547`, section top 96. The composition is unchanged; the section's anchor simply works at that viewport now, which is a small improvement rather than a regression.

The full fix-v9 responsive sweep was also re-run with the new section in place — 12 viewports × 3 languages × 6 anchors — and still reports no page overflow, no clipped text, and no residual clip-path anywhere.

Files changed

File	Change
src/sections/closing/Closing.tsx	new — the section
src/sections/closing/Closing.module.css	new — its styles
src/app/App.tsx	mounts <code><Closing /></code> after Content Universe
src/i18n/en.ts	closing block (shape source of truth)
src/i18n/fr.ts	French closing block
src/i18n/es.ts	Spanish closing block
src/app/App.test.tsx	2 new tests, 3 updated for the new section
e2e/app.spec.ts	7 new tests

Tests

Unit: 27 → 29. The section renders after Content Universe with identity, statement, disclaimer and a `#hero` link; and a "invents nothing" test that fails on any extra link, any form control, any URL/mail/tel/ @, or any digit in non-decorative text. Three existing tests were updated for the new section rather than worked around: the landmark/heading-order test now expects six `h2`s and checks the last two by accessible name, and the reduced-motion test now also asserts the Closing copy and control are present.

E2E: 39 → 46. Per language: the section is Content Universe's next sibling, all four content blocks render in that language, every revealed element settles at `opacity: 1` with no `clip-path`, and clicking back-to-top actually returns `scrollY` to 0 with the hash set. Plus: no overflow and no copy outside the canvas at 320px and 390px in all three languages; AA contrast for the section's copy in light theme; and the reduced-motion resting state.

The `opacity: 1` assertion is the regression guard for the defect above — it fails on exactly the state that shipped in my first attempt.

Validation

Check	Result
<code>npm run typecheck</code>	PASS
<code>npm run lint</code>	PASS
<code>npm run test:run</code>	PASS — 29/29 (was 27)
<code>npm run build</code>	PASS
<code>npm run test:e2e</code>	PASS — 46/46 (was 39)
<code>git diff --check</code>	PASS (exit 0; CRLF advisories only)
<code>npm run format:check</code>	FAIL — 3 pre-existing files, see below

`format:check reports Claude report/fix-v1/report.md, fix-v2/report.md and fix-v3/report.md` — prior fix folders this task does not touch. Every file created or edited this pass is prettier-clean.

Git

No commit, push, reset, clean, or revert. HEAD is still `d309313`. No prior `Claude report/fix-v*` folder was modified, and all pre-existing uncommitted work is intact.

Screenshots

`screenshots/` holds 13 captures.

- `01-before-fix-...` / `02-after-fix-...` — the invisible back-to-top link and its fix, same capture.
- `10-17` — the section at 1440×900 light, 1024×768 fr, 768×1024 es, 844×390 landscape, 390×844 fr dark and es light, and 320×568 es dark and fr light.
- `20` — the Content Universe → Closing boundary, showing the shared hairline seam.
- `21` — the reduced-motion resting state.
- `22` — the focus ring on the back-to-top control.

Verdict

READY FOR REVIEW. The section is complete in three languages, both themes, and from 320px up; nothing above it moved; the one defect found was in the new work, is fixed, and is now guarded by a test. The footer remains untouched, as asked.
